

### Task 5. Fahrenheit to Celsius : PHP operators.

Write a program that reads in a temperature in degrees Fahrenheit and returns the corresponding temperature in degrees Celsius.

The conversion formula is:

$$T_{(^{\circ}\text{C})} = (T_{(^{\circ}\text{F})} - 32) \times 5/9$$

The other way around is:

$$T_{(^{\circ}\text{F})} = T_{(^{\circ}\text{C})} \times 9/5 + 32$$

The user should have the opportunity to input an integer. Based on 2 buttons the user can chose whether he wants to transform that integer into Fahrenheit or Celcius. There should also be a reset button.

### Calculate the temperature

This program will calculate the temperature given by the user to the desired unit of measurement.

Please enter the temperature:

You asked me to calculate how much 21 degrees Celcius would be in degrees Fahrenheit.

**21 degrees Celcius is 95.4 degrees Fahrenheit**
